

Improvements & Suggestions

Improvement: Email Input Guidance During Registration

To enhance usability and reduce input errors, it is recommended to provide a clear example or placeholder format (e.g., *example@email.com*) in the email field during user registration. This would help users better understand the expected format and minimize validation errors.

Improvement: Password Requirements Visibility

During password creation, there are no visible guidelines indicating the required format (e.g., minimum length, use of special characters, numbers, etc.). This may lead to user frustration as users may need multiple attempts to meet the criteria. It is recommended to clearly display password requirements upfront and provide real-time validation feedback while the user is typing.

Improvement: Language Consistency and Localization

The website currently uses Bosnian as the primary language, while the login and registration pages are in English. This inconsistency may confuse users and negatively impact the overall user experience. It is recommended to standardize the language across the entire application. Alternatively, implementing a language switcher (e.g., Bosnian/English) would improve accessibility and make the platform more user-friendly for both local and international users.

Improvement: Visibility of Membership Information for Non-Logged-In Users

Currently, users who are not logged in cannot view membership prices and benefits. This limitation may discourage potential users from registering, as they do not have enough information to make a decision. It is recommended to make basic membership details (such as pricing and benefits) visible to all users, while reserving advanced features for registered members. This approach can improve transparency and increase user conversion rates.

Improvement: Form Validation and Error Messaging

Ensure that all form fields include clear validation rules and user-friendly error messages. Error messages should be specific, actionable, and displayed in real time to help users quickly correct their input.
